

OUR SATELLITE MONITORING SYSTEM

We offer a satellite monitoring service for shipments by land and by sea, which provides:

- control and recording of the container or truck **temperature**
- control of the **potential doors opening** during the shipment
- travelling unit position
- alarms for potential out of range temperature, doors opening and closure, and tampering attempts

The device installation doesn't need particular operations, it is activated and inserted inside the travelling unit at the loading time. Since its activation, on the basis of the selected parameters, it is possible to monitor the container and truck conditions, and to verify the required temperature is maintained. At the same time you can check that the doors were not opened without an authorization, since the container/truck left for its final destination.

Our employees receive real-time potential alarms and are able to provide a supervision/verification of the situation in order to find a prompt solution to the problem.
